It is obvious that everyone was committed to making improvements in the field. Matters such as this add further uncertainty and confusion to the comparisons of the different failure criteria.

The distortional state of deformation in the matrix phase is far too great. Brings together 19 failure theories, with many application examples. The last category, polynomial invariants, sounds mathematical but it is no more so than the other methods. It is this second round of results that will be of concern here since presumably it represents the best performance by each associated theory.

A logical sequence and natural progression of failure cases to be studied could be one issue that dominates and supersedes all. Applications can be found in aircraft, process plants, sporting goods and military equipment.
