The measure was designed to be sensitive to changes in symptoms, functioning, and satisfaction over time. Thus, emerging evidence provides support for the notion that ADHD severity and brain development are linked, and that developmental variations in ADHD phenotypic presentation are associated with variability in early cognitive and neural development. Evaluation and Program Planning.
The average grade improvement over time found in the present study maybe, in
The ONAA also captures satisfaction with the assessment process and product, offering important information for quality assurance purposes. Journal of the International Neuropsychological Society.
Journal of Psychoeducational Assessment. Neuropsychological functioning

in age at diagnosis and duration of pre-existing treatment between the two groups could contribute to differential progress in treatment over the follow-up period. The degree of change between baseline and follow-up in terms of symptoms, social-emotional and school functioning, and assessment satisfaction is most central to our hypotheses about the impact of neuropsychological assessment for youth with ADHD.
